

Finding Astro — Screens 4–16 (Design/Build Prompts)

Screens 1–3 already built: Admin Dashboard, NGO/Volunteer Dashboard, Citizen Home

This doc: the next 13 screens that complete the core loop (Report → Act → Verify → Pay)

Each prompt below is self-contained — paste it directly into your AI design/build tool. All screens should follow the shared design system already established (deep teal primary #0F5C5C, warm amber/coral accent #F2994A, sage green success #4C9A6D, warm red alert #D64545, warm off-white background #FAF8F5, humanist sans-serif type, rounded 2px line icons).

SCREEN 4 — Report an Animal: Category Selection

App: Citizen · Platform: Mobile primary (React Native/Expo), Web secondary

Prompt:

Design a mobile screen that is the single most important entry point in the app — reporting an animal. Title: "What's happening?" Show 5 large, tappable category cards in a grid (2 columns, Wildlife full-width at bottom): Injured Animal, Lost Pet, Found Pet, Stray Concern, Wildlife. Each card has an icon, short label, and one-line description (e.g. "Injured Animal — needs urgent help"). Use warm amber/coral for the card backgrounds to signal urgency and action, deep teal for icons/text. The Wildlife card should look visually distinct (different icon style, slightly muted color) to signal it goes down a different path than the others — do not let it visually blend with the general categories. Add a persistent small "Emergency? Call now" link fixed at the top of the screen, always visible above the grid. No scrolling should be required to see all 5 categories on a standard phone screen.

Why it matters: This is the front door to the entire platform — if this screen is confusing, nothing downstream happens.

SCREEN 5 — Report Form (Adaptive: Injured / Stray / Lost / Found)

App: Citizen · Platform: Mobile primary

Prompt:

Design a single adaptive report form screen used for Injured, Lost Pet, Found Pet, and Stray Concern reports (fields change slightly per category, layout stays consistent). Structure top to bottom: (1) Category chip at top showing which type was selected, tappable to go back and change it. (2) Photo capture — large camera button, camera-first, allow up to 3 photos, show thumbnails once added. (3) Location — auto-detected GPS pin on a small embedded map with a "confirm/adjust pin" option, plus a text address field as fallback. (4) Category-specific fields: for Injured — condition severity (mild/moderate/severe radio buttons), visible injuries checkboxes; for Lost/Found Pet — name (optional), breed, color, collar description; for Stray Concern — brief description, is the animal aggressive (yes/no). (5) Optional contact number field, pre-filled if logged in. (6) Large amber "Submit Report" button fixed at the bottom, always visible. Keep the form short — no more than one screen-scroll. Use plain, non-technical language throughout (no jargon like "ABC" or "case ID").

Why it matters: This is the data-capture screen that feeds the NGO/Volunteer case queue and the Admin complaints queue — field quality here determines whether the whole downstream chain works.

SCREEN 6 — Report: Wildlife Specialist Routing

App: Citizen · **Platform:** Mobile primary

Prompt:

Design a screen shown only when a citizen selects "Wildlife" as the report category. This must feel and function structurally different from the standard report form — it should NOT let the user submit into the general volunteer queue. Show a clear message at top: "Wildlife needs specialist handling" with brief reassuring copy. Below: a simplified form — photo, location (auto-GPS), animal type (dropdown: snake, monkey, bird of prey, other), and a note field. Include a visible safety notice card (muted red/amber, not alarming) reminding the user not to approach the animal. Submit button routes to a specialist wildlife team, and the confirmation screen after submit should explicitly say "Routed to our Wildlife Response Team" — not the generic volunteer confirmation copy. Visually this screen should feel like a distinct, careful sub-flow, not a form variant.

Why it matters: Domain rule — wildlife must never route to general volunteers. This needs to be structurally unmistakable, not just a backend filter.

SCREEN 7 — My Reports: List & Status Tracker

App: Citizen · **Platform:** Mobile primary, Web secondary

Prompt:

Design a screen showing a citizen's submitted reports as a vertical list of cards, most recent first. Each card shows: thumbnail photo, category icon/label, short location text, and a status pill (Submitted / Assigned / In Progress / Resolved) color-coded — gray for Submitted, amber for Assigned/In Progress, sage green for Resolved. Tapping a card expands or navigates to a detail view showing: a horizontal step tracker (4 stages matching the status pill states) with timestamps for each stage reached, the original photo(s) and details submitted, a small map showing the report location, and — once resolved — a short plain-language outcome note (e.g. "Animal was treated and released back to its home area" or "Successfully rehomed"). Empty state (no reports yet) should be warm and encouraging, not blank — include a friendly illustration and a "Report your first animal" button.

Why it matters: This is the trust-building screen — citizens need to see their report led somewhere real, or they stop reporting.

SCREEN 8 — Emergency Helpline / Quick Access

App: Citizen · **Platform:** Mobile primary

Prompt:

Design a lightweight emergency access screen/modal reachable within one tap from anywhere in the app (triggered from a persistent header link). Large, high-contrast layout: a prominent "Call Emergency Helpline" button (tap-to-call), a secondary "Nearest Vet" button that opens a map, and a short list of 2-3 critical situations with one-line guidance each (e.g. "Snake bite — do not attempt to move the animal, call now"). Use the warm red alert color sparingly — for the call button only — with the rest of the screen calm and clear so it doesn't add panic. This should load fast and require zero scrolling on any phone size.

Why it matters: In a genuine emergency, friction costs lives — this screen should be found and used in seconds.

SCREEN 9 — NGO/Volunteer: Case List (Today's Cases)

App: NGO/Volunteer · **Platform:** Mobile primary

Prompt:

Design a mobile screen listing a volunteer's assigned cases for the day as a vertical stack of cards, sorted by urgency then proximity. Each card shows: animal photo thumbnail, case type icon (ABC capture / lost-found / emergency), distance from current location, a status tag (New / In Progress / Awaiting Proof), and a colored left-edge bar indicating priority (red = urgent, amber = standard, teal = low priority). Include filter chips at top (All / Urgent / Nearby / ABC / Other) and a small map toggle icon in the top-right to switch the whole screen to map view showing the same cases as pins. Design for one-handed use — cards should be tall enough to tap comfortably while walking. Include a floating "+" button for reporting a new case directly from the field.

Why it matters: This is the volunteer's actual workday — it needs to be scannable in bright sunlight in under 5 seconds.

SCREEN 10 — NGO/Volunteer: Case Detail

App: NGO/Volunteer · **Platform:** Mobile primary

Prompt:

Design a case detail screen for a volunteer. Top: large photo of the animal, case type badge, and a distance/directions button. Middle: key info block — location address, reporter's note (if from a citizen report), animal description. Below that: a vertical action stepper showing the case lifecycle (Assigned → Captured → Treated/Surgery → Released → Verified), with the current stage highlighted in amber and completed stages in sage green with checkmarks. Each stage in the stepper should be tappable to jump to the relevant action screen (Capture flow, Proof upload, etc.) once it becomes the active stage. Bottom: a persistent action button that changes label based on current stage (e.g. "Start Capture," "Upload Proof," "Confirm Release"). Include a small geo-validation status chip near the location info once capture has happened, showing "✅ Within 300m" or "⚠️ Outside range" clearly.

Why it matters: This is the operational hub screen volunteers return to repeatedly per case — clarity here prevents errors in the ABC compliance chain.

SCREEN 11 — Capture & Geo-Validation Flow

App: NGO/Volunteer · **Platform:** Mobile primary

Prompt:

Design a focused, full-screen flow for logging an animal capture in the field. Step 1: large camera viewfinder-style capture button, live GPS coordinates shown small at the bottom as they lock in. Step 2 (after photo taken): show the captured photo with a geo-validation result card overlaid — a clear pass state ("✅ Capture location confirmed, within 300m of report") in sage green, or a fail state ("⚠️ You're outside the valid capture radius — move closer or flag for review") in warm red with a "Retry" and "Flag for admin review" option. Step 3: a short confirmation form — animal condition, any immediate notes. This entire flow should be completable one-handed while holding a leash, with large buttons and minimal text entry (prefer toggles/checkboxes over typing).

Why it matters: This is where the ABC Rules 2023 geo-validation requirement gets enforced in real time — the pass/fail state needs to be unmissable.

SCREEN 12 — Proof Upload (Surgery / Release)

App: NGO/Volunteer · **Platform:** Mobile primary

Prompt:

Design a proof-upload screen used at two points in a case: after surgery, and after release. Show a segmented control or tab at top to switch between "Surgery Proof" and "Release Proof" contexts (only the relevant one is active based on case stage). Surgery Proof section: upload fields for a before photo, after/certificate photo, and a vet/clinic name dropdown (institution only, never a person's name). Release Proof section: camera capture for a geo-tagged release photo, with the same geo-validation pass/fail pattern as the Capture screen. Each uploaded photo shows a small thumbnail with a re-take option. All photos should show a visible timestamp + location stamp overlay once captured (matching the pattern already used in VaxTrack). Bottom: a clear "Submit Proof" button that's disabled/grayed until required items for that stage are complete.

Why it matters: This is the evidence layer that unlocks payment — reuse the offline-capable photo pattern already proven in VaxTrack rather than rebuilding it.

SCREEN 13 — Payment Tracker (Volunteer/NGO view)

App: NGO/Volunteer · **Platform:** Mobile primary, Web secondary (NGO admin)

Prompt:

Design a payment tracking screen showing a list of cases with pending or completed payments. Each row/card shows: case thumbnail, a 3-gate horizontal stepper (Surgery Complete → Proof Uploaded → NGO Verified), with completed gates in sage green, current gate in amber, and pending gates in gray outline. Show the payment destination clearly as an institution name (hospital/clinic) with a small building icon — never a person's name or account, reinforcing that money never goes to individuals. Include the payment amount and expected/actual payment date. A detail view (tap into a row) shows the full audit trail — timestamps for each gate, who verified it, and links to the uploaded proof photos. Use a calm, ledger-like visual treatment here — this screen needs to feel auditable and precise, more like the Admin dashboard's tone than the rest of the volunteer app.

Why it matters: Money-integrity screens need to visually earn trust — this is the volunteer-facing half of the same rule the Admin dashboard enforces from the government side.

SCREEN 14 — Admin: Complaints/Incidents Queue

App: Admin/Government · **Platform:** Web primary

Prompt:

Design a web dashboard screen showing all incoming citizen reports as a filterable, sortable table/list. Columns: thumbnail, category (Injured/Lost/Found/Stray/Wildlife with distinct icon per type), zone/ward, time since submission, current status (New/Assigned/In Progress/Resolved as colored pills), assigned NGO/volunteer (avatar + name), and an SLA countdown/breach indicator (turns red when overdue). Include filter controls at top: zone selector, category filter, status filter, date range, and a search bar. Support both a dense table view and a kanban-style view (toggle between them) for teams that prefer visual triage. Wildlife reports should be visually flagged/separated (e.g. a distinct row accent color) since they follow a different assignment path than general reports. Row click opens the Complaint Detail screen.

Why it matters: This is where every citizen report lands for triage — without this screen, the reporting flow has nowhere to go on the government side.

SCREEN 15 — Admin: Complaint Detail & Assignment

App: Admin/Government · **Platform:** Web primary

Prompt:

Design a web detail/side-panel view (opens from the Complaints Queue) for a single report. Top: full photo(s), category, location on an embedded map, and the citizen's submitted description. Middle: an assignment panel — dropdown/search to assign to an NGO or specific volunteer, with a suggested-assignment hint based on proximity and current volunteer workload. Show a status stepper matching the field-side lifecycle (Assigned → Captured → Treated → Released → Verified) so admins see the same stages volunteers see, kept in sync. Include an internal notes/comment thread for admin-to-admin or admin-to-NGO coordination (not visible to the citizen). Bottom: action buttons — Assign, Escalate, Mark Resolved, Flag for Review. Keep this dense but organized — this is a working tool for staff triaging many reports per day, not a showcase screen.

Why it matters: Pairs with the Queue screen to complete the government side of the report lifecycle — this is where oversight actually happens.

SCREEN 16 — Admin: Payment Approval Queue

App: Admin/Government · **Platform:** Web primary

Prompt:

Design a web screen listing all cases with payments pending government/admin-level approval. Table/list format with columns: case thumbnail, NGO name, institution payee (hospital/clinic — never an individual), amount, the 3-gate status stepper (same visual pattern as the volunteer-side Payment Tracker, kept consistent), and days pending. Rows where all 3 gates are complete but awaiting final admin sign-off should be visually prioritized (e.g. subtle highlight) since these are ready to act on. Clicking a row opens a detail view with the full proof trail — surgery photos, release photos, NGO verification note — laid out for quick visual confirmation before approving. Include bulk-select with a bulk-approve action for efficiency, plus a "Flag for review" path for anything that looks off. This screen should feel audit-grade: precise, well-labeled, exportable (include an export-to-CSV/PDF button for compliance records).

Why it matters: This is the final checkpoint in the money-integrity chain — it's what makes the "money never goes to individuals" rule auditable, not just a policy statement.

Build sequencing suggestion

If building/generating in order, this sequence keeps every screen testable against a working screen that already exists:

- 1. Screens 4 → 8 (Citizen reporting flow) — testable against the already-built Citizen Home
- 2. Screens 9 → 13 (Volunteer field flow) — testable against the already-built NGO Dashboard
- 3. Screens 14 → 16 (Admin oversight flow) — testable against the already-built Admin Dashboard, and closes the loop by receiving what Screens 4-8 produce

By the end of screen 16, you have a complete, demonstrable loop: a citizen can report → a volunteer can act on it with geo-validated proof → an admin can see it, approve payment, and export a compliance report.
